

From obs 4/25/24: "Came across a relatively large wet avalanche when approaching Texas meadows from Bradley's meadows. Elevation around 7600ft, aspect, SSE. Depth: to ground. Considering the new snow on top of the debris, I'm guessing this slid prior to the storm last week. The slide path was melted out to dirt. Out of curiosity, we dug just to the lookers right of the slide and found soft snow near the ground - still evidence of crystal structure but could make a snowball if squeezed. Best guess is that a point release wet slide entrained enough snow to step down and release the whole face." Photo: A. Kautzer

Advisory Region

Bridger Range

Longitude

-110.94W

Latitude

45.84N
