Location/Description

Hellroaring Basin / Mt. Nemesis

Activity

Skiing

Snow Observations

We found a 2.85m settled base at roughly 7,000' elevation base camp of Hellroaring Powder Guides.

The temps have been cold, but warming into the high 20s, low 30s during sunny periods.

A sample snowpit showed a weak layer of coner at about 50-60cm below the surface, made of very small facets.

However, an ECT was non-reactive. No signs of recent avalanches in the basin were present. Hower, some debris piles from older slides were apparent in the larger runout zones on Mt. Nemesis.
