Yellowstone Club Ski Patrol triggered a slide with explosives breaking at the ground during avalanche mitigation work on Friday, 1/10/2020.

From Yellowstone Club Patrol: "It's a NE facing slope at 8500' ... got an avalanche to release on an old layer of well defined surface hoar (perhaps from mid-December). In some areas it stepped to ground. The crown was 2-4' deep and the avalanche was recorded as R3/D2. The avalanche slid to the bottom of the runout and placed 3-12' of snow in the road and completely blocked the road. This was a relatively large slide for this particular path this early in the season."
