

From obs (2/28/21): "I've attached a photo of a small, D1.5, slide I saw on a thin S facing slope at 9000'. It was definitely more than a few days old. HS in the areas you would want to ski is 130-180cm, with a distinct drop felt with a probe at the bottom of the pack. Other areas are very scoured up there." S. Jonas
