

Bridger ridge wind slabs

Date

Thu, 11/17/2022 - 12:30

Activity

Skiing

Went on a tour today with a buddy to check out the snow conditions in the Bridgers. We found cold temps and steady blowing wind while climbing up to saddle, actively loading the east aspect up high. Was able to stomp on new drifts/cornices and see wind slabs crack and go. These slabs didnt propagate more than 6 inches deep, and they moved very slow down hill. Creamy snow conditions but overall looking good (except the rocks). Cheers!

Region

Bridger Range

Location (from list)

Saddle Peak
