Large Skier Triggered Avalanche Hyalite Pk

Hyalite Peak Northern Gallatin 3/4/2023 Code HS-ASu-R4-D3-O Elevation 9800 Aspect NE Latitude 45.38100 Longitude -110.96100 Notes

(NE, HS, ASu, D3, R4)

We toured into Hyalite with the intention of skiing the North East Face of Hyalite Peak. Our primary concern was <u>wind loading</u> on <u>leeward</u> slopes. Before starting the day 6" of snow was reported in the Northern Gallatin range however we only found up to three inches of new snow. Approaching the saddle we found soft snow (2-3") on a pencil-hard crust. Once reaching the summit we descended carefully onto the NE face observing a shooting crack on a pocketed soft wind-<u>slab</u> after performing a <u>ski cut</u>. Noting this we descended further staying on the ridgeline. We then found a similar snowpack to the saddle with no cracking after a few more ski cuts and decided to ski one at a time down the duration of the face. Skier 1 skied a few turns down the face when a loud wumph was heard and the whole face started sliding. Skier 1 was caught, carried, and partially buried at the tail of the <u>slide</u> path. Skier 2 observed skier 1 and skied down to them after the avalanche stopped. Skier 1 was then fully dug out and both skiers left the <u>avalanche path</u> unharmed. The <u>slide</u> was thought to be (D3,R4) breaking all the way to the ground and spanning at least 500' wide.

Number of slides 1 Number caught 1 Number buried 0 Avalanche Type Hard slab avalanche Trigger Skier **Trigger Modifier** u-An unintentional release R size 4 D size 3 **Bed Surface** O - Old snow
