

4-6'+ deep Persistent slabs (2) on Henderson Mtn.

Henderson Mountain

Cooke City

1/9/2025

Code

HS-N-R2-D2-O

Elevation

9900

Aspect

NE

Latitude

45.05240

Longitude

-109.94500

Notes

We looked at two 4-6' deep persistent [slab](#) avalanches that were reported yesterday on the east side of Henderson Mtn., which likely happened yesterday. Wind-[loading](#) was the likely [trigger](#). There were not tracks near the larger one above the bench, where riders could easily get to, but they could have been filled in. The other [slide](#) was below the highest point below a [cornice](#) and likely natural. Both looked like they broke on facets at the bottom of the snowpack.
