

Unstable ECT on weak snow in Beehive

From obs.: "Dug a pit just over the ridge from Beehive Basin into Middle Basin on a part of the slope that was less wind-affected than the rest. Performed an ECT and got a result of ECTP-24. The failure occurred on what appeared to be the same layer that was observed at Buck Ridge earlier this week - a thin layer of facets underneath a fairly solid crust (found approximately 30 cm from the surface). Given this observation, we decided to take it easy and ski some low angle meadows down into bear basin." Photo: E. Telford
