

Small soft slab debris near beehive peak

"Was out today and found buried surface hoar 10-15 cms down. Some previous natural activity on this layer on steeper north aspects with very shallow soft slabs, but mostly dry loose at this point. Not much slab formation since the last ppt event. This could be a problem when more snow and wind in the next few days." Photo: T. Woodward

Advisory Region

Northern Madison

Longitude

-111.41W

Latitude

45.30N
